## GetVariations

### Description

Given an ASIN, the `GetVariations` operation returns a set of items that are the same product, but differ according to a consistent theme, for example size and color. These items which differ according to a consistent theme are called variations. A variation is a child ASIN. The parent ASIN is an abstraction of the children items. For example, a shirt is a parent ASIN and parent ASINs cannot be sold. A child ASIN would be a blue shirt, size 16, sold by MyApparelStore. This child ASIN is one of potentially many variations. The ways in which variations differ are called dimensions. In the preceding example, size and color are the dimensions.

`GetVariations` supports the following high-Level resources:

- [BrowseNodeInfo](#)
- [Images](#)
- [ItemInfo](#)
- [OffersV2](#)
- [VariationSummary](#)

### Availability

All locales, however, the parameter support varies by locale.
