## GetBrowseNodes

### Description

Given a BrowseNodeId, GetBrowseNodes operation returns the specified browse node's information like name, children and ancestors depending on the resources specified in the request. The names and browse node IDs of the children and ancestor browse nodes are also returned. GetBrowseNodes enables you to traverse the browse node hierarchy to find a browse node.

GetBrowseNodes Operation returns Id, DisplayName, ContextFreeName and SalesRank response elements by default. For other response elements associated, with GetBrowseNodes supports the following high-level resources:

- [BrowseNodes](#)

### Availability

All locales.

### Request Parameters

Check [Common Request Headers and Parameters](#) for more information on common input parameters. For detailed information on how to create and send a request, refer [Using cURL](#). All GetBrowseNodes input parameters are listed below:
