Common Request Headers and Parameters

This document describes the request headers and parameters that are common to all Creators API operations.

Headers

The following table describes the HTTP headers that must be included in all Creators API requests:

Header	Definition	Required	Example Value
Content-Type	The content type of the request body. Must be set to application/json.	Yes	application/json
Authorization	Bearer token for authenticating API requests. The value should be in the format: Bearer <access_token>, Version <credential_version>, where credential_version is the API version for your region (2.1 for NA, 2.2 for EU, 2.3 for FE). The access token is obtained using OAuth 2.0 client credentials flow.	Yes	Bearer eyJraWQiOiJ... , Version 2.1
x-marketplace	Target Amazon marketplace passed as an HTTP header. The value determines the locale where the API request is targeted. For example: www.amazon.com for US, www.amazon.co.uk for UK. For more information, refer <a href="#">Marketplace Reference</a> .	Yes	www.amazon.com
