SearchItems

Description

The SearchItems operation searches for items on Amazon based on a search query. The Amazon Creators API returns up to ten items per search request.

A SearchItems request requires a search category, which, if not specified, defaults to "All" and value for at least one of Keywords, Actor, Artist, Author, Brand or Title for searching items on Amazon.

SearchItems supports the following high-level resources:

- [BrowseNodeInfo](#)
- [Images](#)
- [ItemInfo](#)
- [OffersV2](#)
- [searchRefinements](#)

Availability

All locales, however, the parameter support varies by locale.

API Features and Best Practices

You can refine SearchItems request to return the results you want. Try different parameter combinations to customize search results. Moreover, the API helps you refine search requests by giving out dynamic search
