Understanding Versions

When working with CreatorsAPI, you'll encounter several different version numbers. Here's what each one means:

Version Types

Version Type	Example	Where Used	Purpose	Notes
Credential Version	`2.1`	Authorization header for API requests	Specifies which credential format to use for authentication	Automatically assigned when creating credentials; varies by region (NA: 2.1, EU: 2.2, FE: 2.3)
SDK Version	`1.1.2`	SDK Package	Tracks which version of the SDK library you are using	Follows semantic versioning (MAJOR.MINOR.PATCH); see SDK Changelog
API Version	`v1`	Endpoint URL path	Identifies which version of the API endpoints to call	Determines available operations and features; current version is `v1`
Resource Version	`OffersV2`	Response data structures	Specifies which version of the data format you want returned	Use newer versions like `OffersV2` for improved data quality and additional fields
